

# Piezoresistive pressure transducer

Model 8540

### **Key features**

- 15, 50, 100, 200 and 500 psia ranges
- 300 mV full scale
- High temperature, +500°F (+260°C)
- Absolute reference

### Description

Model 8540 is a rugged, miniature, high sensitivity piezoresistive absolute pressure transducer. The transducer has a 0.15 inch (3.8 mm) face diameter and is available in ranges from 15 to 500 psia. 8540 features high temperature performance to  $+500^{\circ}$ F ( $+260^{\circ}$ C) and can operate with diminished lifetime to  $+600^{\circ}$ F ( $+316^{\circ}$ C). Its excellent linearity combined with very high resonance makes it ideal for measuring dynamic pressure.

The transducer employs silicon strain gages bonded to a micro-machined silicon diaphragm for maximum sensitivity and wide frequency response. Internal sensitivity compensation and zero trim provides accuracy to  $+500^{\circ}$ F ( $+260^{\circ}$ C). This transducer exhibits low photo-flash sensitivity and high stability during temperature transients.

8540 is designed to measure static or dynamic pressures. Its small diameter suits it to flush mounting for measuring skin pressures on aircraft, inlet distortion pressures in turbine engines or transmission pressures in automobiles. The transducer's high frequency response permits use on small scale models in wind tunnels.

Recommended electronics for signal conditioning and power supply are model 126 and 136 general purpose three channel conditioners, ultra low noise 4430A conditioner, or the 4990A-X (Oasis) multi-channel rack mount system.

# **Specifications**

The following performance specifications conform to ISA-RP-37.2 (1964) and are typical values, referenced at +75°F (+24°C) and 100 Hz, unless otherwise noted. Calibration data, traceable to National Institute of Standards and Technology (NIST), is supplied.

# **Piezoresistive pressure transducer** Model 8540

### Accessories

| Product | Description            | 8540     |
|---------|------------------------|----------|
| EHR97   | O-ring, fluorosilicone | Included |
| 25045   | Cable, 4 conductor     | Optional |

#### Notes

- 1. 1 psi = 6.895 kPa = 0.069 bar.
- FSO (Full Scale Output) is defined as transducer output change from 0 psia to + full scale pressure.
- 3. Zero Measurand Output (ZMO) is the transducer output with 0 psia applied.
- Significantly higher thermal transient errors occur if the excitation voltage exceeds 10 Vdc. For sensitive phase change studies, many users reduce the excitation to 5 Vdc or even 1 Vdc.
- 5. The metal screen partially shields the silicon diaphragm from incident radiation. Accordingly, light incident at acute angles to the screen generally increases the error by a factor of 2 or 3.
- 6. Warm-up time is defined as elapsed time from excitation voltage "turn on" until the transducer output is within ±1% of reading accuracy.
- Use of excitation voltages other than 10.0 Vdc requires manufacture and calibration at that voltage since thermal errors increase with high excitation voltages.
- 8540 can be operated at 500°F (260°C) continuously, at 550°F (288°C) for up to 24 hours and at 600°F (316°C) for up to 4 hours.
- 9. Model number definition:

#### Other options

M4 Gel M8 "A" screen, black grease

Continued product improvement necessitates that Endevco reserve the right to modify these specifications without notice. Endevco maintains a program of constant surveillance over all products to ensure a high level of reliability. This program includes attention to reliability factors during product design, the support of stringent Quality Control requirements, and compulsory corrective action procedures. These measures, together with conservative specifications have made the name Endevco synonymous with reliability. 090419
